

Your own website can finally show what's actually open.

Right now the only place a customer can see a real opening is the site charging you twenty percent. That ends the day you plug this in.

\$24,000

What a charter doing **\$400,000 a year** through a 20% booking site keeps by moving just **three out of ten** bookings to their own website. Not a projection – arithmetic off your own statements.

THE MATH, ON A \$400K CHARTER	
Booked through FareHarbor at 20%	-\$80,000
Move 30% of it to your own site	+\$24,000
What this costs you for the year	-\$3,588
Net, first year	+\$20,412

How it knows

Every booking platform you're on sends you an email the second someone books. FareHarbor does. Booking.com does. Airbnb does. Peek, Square, Toast – all of them. **They cannot turn that off without breaking their own product.**

We read those emails. That's the whole mechanism. No API to apply for, no partnership to get approved, nobody's permission to ask for.

- YOU DECLARE

6 jet skis
- FAREHARBOR

2 booked, 10:00–12:00 → 4 left
- BOOKING.COM

1 booked, 10:30–12:30 → 3 left
- CANCELLATION

1 released → 4 left

FareHarbor doesn't know about your Booking.com reservation.
Booking.com doesn't know about FareHarbor. You're the only one who sees all of it at once – and now so does your website.

Works the same for

Tables Six tops at 7:30, two left. On your own page, not just on the reservation app.	Rooms & condos Across every OTA you list on, reconciled into one honest number.
Chairs & slots Salon, charter, tee time, pontoon. Anything with a capacity and a calendar.	

\$299

PER MONTH

Bring one statement to the first meeting.

Your commission line for last year. We do the subtraction together. If the number doesn't beat what this costs, don't buy it.

THE ONE SENTENCE THAT SELLS IT

"Your website shows what's actually available, right now, across every platform you're on – so people can book you direct instead of through the site taking twenty percent."

EVERY BUSINESS • THE PRICING PROMISE

We take zero percent of your bookings.

Not a discounted rate. Not a lower rate than theirs. Zero. Keep your booking platform, keep your calendar, keep your customers.

0% Our cut of what you sell – forever. You pay a flat monthly fee for the software and nothing else. **A busy month costs the same as a slow one.**

Why nobody else does this

Because a percentage is how they make their money, and it scales with your success instead of with their cost. The better your season, the more you owe them.

Ours doesn't scale with your revenue because **our cost doesn't either**. Serving your hundredth booking costs us the same as your first: nothing.

Keep FareHarbor Or Toast, or Square, or Peek, or whatever you already run. We're not replacing it and we're not asking you to switch.	Flat, not metered No per-booking fee, no per-message fee, no surprise bill in July because you had a good week.
Cancel and keep working Stop paying and the machine keeps running exactly as it is. It just stops getting new things.	

Every other platform in your life makes more money when you do.
We make the same. That's the whole difference, and it's why we can
tell you to keep the tools you already have.

\$299

PER MONTH • FLAT

Ask them what their number is.

Every competitor in this category takes a percentage, a per-seat fee, or both.
Make them say it out loud next to ours.

EVERY BUSINESS • THE CORE OF IT

Change your hours once. Not five times.

Google, your website, Facebook, the booking site, the POS. One place, one time, and it lands everywhere – verified.

5 min

What it takes you today to update a holiday closing in five places, assuming you remember all five. **Most owners forget at least one, and the one they forget is the one the customer checks.**

And the part that actually costs you money

Every app you use redesigns itself. Toast moves a button. Google changes a screen. The automation you set up last spring quietly stops working and **nobody tells you** – you find out when a customer shows up to a closed door.

When that happens, we already know. Every night, every flow on every machine checks that the screens it expects are still there. **When one changes we fix it once, and the fix is on every customer's machine by morning.**

You are not buying software. You're buying the fact that we absorb every app redesign, forever, so you never have to think about it again. *That* is what the monthly fee is for.

What it will do for you

Hours Holiday closings, seasonal changes, the day you close early for a wedding.	Prices Menu prices, rates, packages. Every place they're listed, at once.
Posts Tonight's special, the catch of the day, the band on Friday.	Photos New menu, new boat, new room. Uploaded everywhere it belongs.

How it works, plainly

A real Android phone sits in a dock on your counter. **Your SIM card, your logins, your apps** – the same ones you use now. It's remote-controlled at human speed. It taps the same buttons you would.

Then it checks. After it changes your hours on Toast, it goes and looks at your public page in a browser to confirm the change is really there – a different way in than the one it used to write. **You get a screenshot, not a promise.**

\$299
PER MONTH

Text it and watch.

First demo: you text "change Friday to 9 to 5." We hand you the phone and you watch it happen, then you check Google yourself.

RESTAURANTS • BARS • BEACH CLUBS

A menu that is never wrong, on every screen it appears.

The QR code on the table, your website, Google, the delivery apps. One menu behind all of them, and it's the one you actually printed.

86'd

The word your kitchen already uses. Say it once at 6 p.m. and the grouper comes off the QR menu, the website and the delivery listings **before the next table scans it.**

What it kills

The PDF The one from 2023 that's still on your website with the old prices. It's gone.	The reprint Change a price without a trip to the printer, and without a sticker over the old one.
The apology "Sorry, we're out of that" – after they already decided they wanted it.	

Then it does something no menu has ever done

Because the QR scan happens at a table, at a time, and the check closes on the same ticket, the menu knows **what that table actually ordered.** Not "someone

visited the menu" – the shrimp scampi, at 7:42, table nine.

That's what turns a menu into the most valuable thing on the table. It feeds the review system on the next sheet, and neither one works without it.

Every other QR menu is a PDF with extra steps. Yours is the only one that closes the loop between what a guest looked at and what they actually ate.

Included

IN THE MONTHLY

Bring the current menu to the first meeting.

We'll have it live on a QR code before you leave, and you can change a price from your phone while we're sitting there.

RESTAURANTS · CHARTERS · ANYONE WITH A REVIEW PROBLEM

Reviews from people who actually ordered the shrimp scampi.

Not a star rating for the whole restaurant. A rating for the dish, from the person who ate it, tied to a real check.

Real

We know they were there, when they sat, what they ordered and what they paid, because the ticket says so. **In an internet filling up with generated reviews, a receipt is the only thing left that can't be faked.**

What a guest sees

Big Chicken Alfredo — 4.8 · 61 verified orders

Shrimp Scampi — 4.9 · 44 verified orders

Calamari — 4.4 · 88 verified orders

Bushwhacker — 5.0 · 210 verified orders

Why this is worth more than your star rating

A 4.3 tells a tourist nothing. **"The bushwhacker is a 5.0 across two hundred and ten people who actually bought one"** tells them where to go tonight.

And it tells you something no review site ever has: the calamari is dragging. Not the restaurant — the calamari. You can fix a dish. You can't fix a 4.3.

Nobody can astroturf this. To leave a review you had to be in the building, at a table, with a closed check. That's the moat, and it's permanent.

Where they end up

On your own page, on the QR menu, in the local directory, and in the answer an AI gives when someone asks what's good nearby. **You own them. We publish them everywhere and take nothing for it.**

Included

IN THE MONTHLY

Pick your worst-selling good dish.

That's the one to watch first. When it starts getting verified fives next to its name, it stops being a secret.

EVERY BUSINESS • PHONE AND TEXT

Your business line answers itself. From your own number.

Not a 1-800. Not a forwarding service with a strange area code. The number already on your truck, your sign and your cards.

Per-message fee. Your own SIM is in the phone on your counter, so texts go out on your real line at your carrier's rate. **No middleman taking a cent a message to send a text from your own number.**

Inbound — it answers

"Y'all open Sunday?"

Answered in seconds, with the hours it just verified this morning.

"Any boats at 2?"

Answered from live availability – across every platform, not just one.

"Do you have gluten free?"

Answered off the real menu, the one you changed at lunch.

Outbound — you talk to your own list

Slow Tuesday, forty tables open. Text the people who've actually been in before:

"Half off bushwhackers till 6." From your number, so it lands like a text from a person instead of a marketing blast.

And it's your list. We don't rent it, resell it, or hold it. If you leave, you leave with it.

Everybody sells you a texting product with a number you've never seen before. Customers ignore those. They don't ignore the number that's been on the sign for eleven years.

It's also how you approve things

When the system wants to do something that matters – change a price, send an invoice – it texts you first and waits. **You reply YES.** Nothing irreversible happens without a person saying so.

\$299

PER MONTH · YOUR SIM

You buy the phone. Forty dollars.

Any Android from any store. Put your SIM in it, sign into your apps, plug it into the box. That's the whole setup, and the phone is yours.

EVERY BUSINESS • GETTING FOUND

Ask any AI who has crab legs nearby. It can't tell you.

Every assistant your customers now use is guessing from scraped, stale, second-hand listings. Yours will be the one that actually knows.

Try it tonight. Ask for crab legs within five miles, or who has a six-top free at 7:30, or which charter has two seats tomorrow. **Nothing on earth can answer those questions today** — because nobody has the data.

Why nobody can answer it

The answer would need live menus, live availability and item-level truth from thousands of small businesses. **No listing service has that**, because the businesses have never had a way to publish it.

You'll be publishing all three, every day, as a side effect of running your business. Not extra work — the same updates you're already making.

Where it goes

Google & the maps Hours, photos, posts, menu. Pushed and verified, not typed in and hoped for.	The local directory Your chamber, your tourism board, the regional guide. Fed from the same truth.
The assistants Published in a form an AI can read directly, so it quotes you instead of guessing.	

Listing services charge \$200 to \$1,000 a year per location just to push your hours around – and they hold the distribution hostage to the subscription. We publish yours everywhere and charge nothing for it. It's your data.

The part that compounds

A tourist asks for the best calamari on 30A. The answer comes back with **real numbers from real receipts** at four restaurants, and one of them is yours.

That answer gets better as more businesses join, which is why the first ones in a town matter most. **Being early here is worth more than being big.**

\$0

FOR DISTRIBUTION

Ask your phone about your own restaurant.

Right now, in front of us. Whatever it gets wrong is the pitch – and it's usually the hours.

THE HARDWARE • GHOST

A computer that works for you. Not for an AI company.

A small box on the wall or under the counter. It runs your business, it holds your data, and it belongs to you the way a truck belongs to you.

Yours

Not a cloud account. Not a seat in someone's platform. A machine you bought, in your building, that keeps working if we disappear. **We can't read what's on it, because there's no way in from our side.**

Four things that are true and almost nobody can say

We can't see your books

There's no remote access. Not "we promise not to look" – there's no door. It isn't built.

It can't be broken by an update

If an update doesn't come up right, the box puts itself back the way it was. You never find out.

Stop paying, keep working

It runs forever, frozen where it is, still patched for security. You just stop getting new things.

Wipe it if you want

It's a Linux computer. Put anything you like on it. It's your hardware.

What you see

A screen that looks like a smart TV, because you already know how to read one. Big tiles, a remote, no menus to hunt through. **No terminal, no file manager, nothing that looks like a computer** unless you go looking for it.

On it, first thing in the morning: **three things that need your OK.** Reply to Maria about the Thursday quote. Invoice 1184, \$2,400, ready to send. Reorder twelve units, \$890, usual supplier. You approve them with coffee in your hand.

Every AI company is racing to get inside your business so your data becomes theirs. This is the opposite. The brain sits on your counter, the data stays in the building, and any AI you like plugs into it — ours, theirs, or the free one.

\$2,495

ONCE · THEN \$299/MO

Or don't buy the box at all.

It runs on a computer you already own for the same monthly. The box is the easy way, not the only way.

THE PLATFORM • WHAT YOU'RE REALLY BUYING

Everything anyone adds to it makes yours worth more.

You're not buying a finished product that stops where it is today.
You're buying the thing all of it plugs into.

One

One login, many apps. Add a booking app, a loyalty program, an inventory tool, a payroll connection – **they all run on the same box, on the same account, on your own data**, without you signing up for anything new.

The app store

Anything that runs on your box arrives from one catalog, the way apps arrive on a phone. Search, install, done. **You'll never see a GitHub page or type a command.**

Everything in it is checked before it's listed: scanned, signed, and tested against your exact machine. And every app is boxed in – it gets the permissions you grant and nothing else, including ours.

Triggers "When a five-star review comes in, post it." "When the last jet ski books, text me." You set the rule once.	Plug-ins New platforms as you adopt them. A new POS doesn't mean a new system – it means one more app.
Your own models Swap the AI underneath any time. Local and private, or your own ChatGPT key. Never locked to one.	Outside developers Anyone can build for it. They get paid; they never get your data.

The part most owners don't think about until year two

Every system you've ever bought got worse over time – the vendor moved on, the integrations broke, the price went up. **This one gets better every month without you doing anything**, because that's literally the product.

You're not buying what it does today. You're buying the fact that it keeps absorbing everything that changes underneath you – every app redesign, every new platform, every price change – for as long as you're paying.

\$299

PER MONTH · EVERYTHING

Start with one thing.

Pick the single job that annoys you most this week. We turn that one on. Everything else waits until you ask for it.
